Coronavirus (COVID-19) outbreak in South Korea

Last update : 8 April 2020

Question 1 "How Many People Have Been Infected So Far?"

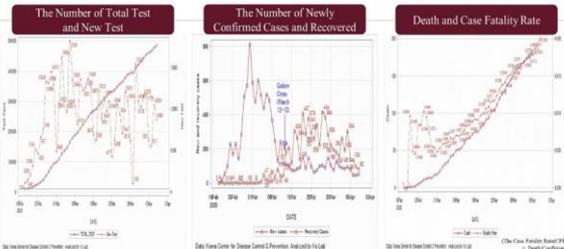

The accumulated number of confirmed cases in South Korea is 170,344 as of April 8. It used to be one of the top 3 countries that are heavily hit by the COVID-19 but now reached 170,000. Since mid of March compared to the previous period, the increasing trend is getting slowed. More than 400,000 cases of coronaviruses have been confirmed in the US (approx. 434,114) and it is followed by Spain, Italy and Germany which recorded more than 100,000 confirmed cases.

Since its peak on 29 Feb, the number of additional confirmed cases has been continuously decreased and no trend is also heading downwards. Still, there are some ups and downs but the overall size of the newly confirmed cases is only 5-10% of the peak. The change ratio after mid of March also shows a very wide shape. Compared to the ratio in Feb, the ratio has been flattened and the trend would be maintained until the end of the epidemic.

The number of patients under quarantine is a crucial figure to explain the upcoming situation. South Korea reached its peak on 12 March and ever since the number has decreased until now. In other words, the recovering patients are increasing and the spread of virus is getting lowered and slowed. This can be interpreted that South Korea is now entering the decrease phase of epidemic; however, the government should be vigilant for any unpredictable situations.

Question 2 "Will The Patients Immediately Die?"

The number of total test in South Korea is reaching almost 500,000 and its positivity rate is 2.2% according to the official report. Positivity rate is calculated [positive tests / total number of tests conducted] * 100%. South Korea has used various innovative testing method such as "Drive-Through" to help diagnosis patients and keep them from infecting others in hospital waiting rooms.

The solid graph shows the number of newly confirmed cases. It targeted up to the 800 on Feb 29 and the showing a decreasing trend afterwards. The dotted line shows the number of recovered. Compared to early stage of the pandemic where there were only few recovered, the number is drastically increasing up to hundreds since mid of March. This is also related to the "lockdown" event.

The total number of death is reached 208 as of 8 April. While there are 17,669 deaths in Italy, 14,202 in Spain and 14,762 in the US, the total number of death in South Korea is relatively small compared to the level of its infection statistics. CFR is continuously increasing and now it reached at 1.8% but still below 2%. While in Italy and France, it is higher than 10%. WHO roughly estimates the world CFR as 1.8%.

Coronavirus (COVID-19) outbreak in South Korea

Last update : 8 April 2020

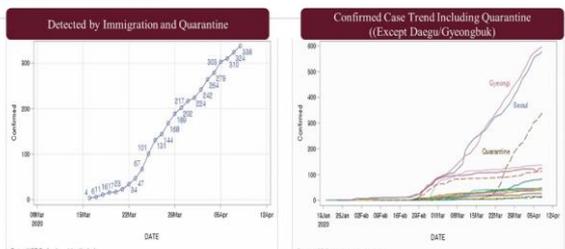

Question 3 "Which Region Is Heavily Hit By The Virus?"

Seoul still has relatively fewer patients than Gyeongbuk. Daegu area however, the number of patients in Seoul and Gyeongbuk province is still increasing. Other than these regions show a very small change of the confirmed cases.

Given that Daegu/Gyeongbuk/Busan are heavily hit by the COVID-19 as shown the above graph, the newly confirmed cases in these 3 regions has decreased since Feb 29. In the beginning stage of the COVID-19. Notably, South Korean government is mostly testing members of a religious group called Shincheonji, especially those who are residing near Daegu so that the result had surged up. However, other regions do not show a decreasing pattern but still show a fluctuating one until now. Government should pay more attention to the quarantine in those sensitive regions.

Question 4 "Are We Still At The Phase Of Increase??"

As we have seen in the previous page, it is proven that South Korea is seeing a decline in its daily new coronavirus infections, but health authorities remain on high alert over imported cases. Due to the rise in imported coronavirus cases from mid of March, the government has required all arrivals to self-quarantine for two weeks to stop coronavirus cases coming from abroad. There were several terrible cases that people coming abroad did not keep the self-quarantine period and exposed their daily life. WHO roughly estimates the world CFR as 1.8%. It was also by the related local governments for the infectious actions.

The number of daily new cases in the metropolitan area has continued to increase mainly due to mass infection cases at major general hospitals and churches and imported cases. Despite a slowing but still continuing spread of cluster cases, the country on April 8 decided to extend its social distancing campaign for another two weeks until April 19. It prohibits mass gatherings while also advising people to voluntarily keep their distance from others.

Coronavirus (COVID-19) outbreak in South Korea

Last update : 8 April 2020

Question 5 "Does Gender and Age have a Correlation With?"

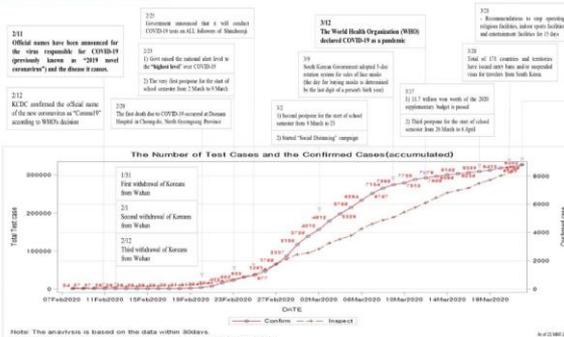

There was an allegation that male is more vulnerable to the COVID-19 based on Chinese data. However in Korea, the number of female patients is almost double that of male patients. There are many reasons why the number of female cases is higher than that of male regardless activities, small group infections including Zumba dance seminar started in Cheonan area, Gangjeo Call center, several hospitals in Seoul/Gyeongbuk province etc.

As shown in the upper panel, the most infected are 20s, which takes up almost 30% of the infected and the 50s is following next. On the below panel, the red graph which is age 20-29 takes up more than half of the confirmed cases and the downward pattern of both under and over 50s is fluctuated since 01 March but quite consistent. We posit that the high infection of the 20s is related to their social activities including religious activities.

The country's death toll rose to 208 and most fatality cases are concentrated in the old age group over 50s. This suggests that the fatality rate of COVID-19 is still somewhat high to the aged but the risk to the young and old having an underlying disease would be even far lower than that. However, we also have to focus that the cases of death without underlying disease has slightly increasing. Still the CFR in 20s is zero but it doesn't mean that the young are 100% safe to the virus.

Question 6 "Has The Government Responded Appropriately?"

Note: This analysis is based on the data within 80 days. Data source: Korea Center for Disease Control & Prevention, analyzed by Fo Lab

This paper is based on the Statistics published at every midnight by KCDC

Government Responses to COVID-19 in South Korea

2/11
Official names have been announced for the virus responsible for COVID-19 (previously known as “2019 novel coronavirus”) and the disease it causes.

2/12
KCDC confirmed the official name of the new coronavirus as “Corona19” according to WHO’s decision

2/25
Government announced that it will conduct COVID-19 tests on ALL followers of Shincheonji

2/23
1) Govt raised the national alert level to the “highest level” over COVID-19

2) The very first postpone for the start of school semester from 2 March to 9 March

2/20
The first death due to COVID-19 occurred at Daenam Hospital in Cheong-do, North Gyeongsang Province

3/12
The World Health Organization (WHO) declared COVID-19 as a pandemic

3/9
South Korean Government adopted 5-day rotation system for sales of face masks (the day for buying masks is determined by the last digit of a person’s birth year)

3/2
1) Second postpone for the start of school semester from 9 March to 23

2) Started “Social Distancing” campaign

3/21
- Recommendations to stop operating religious facilities, indoor sports facilities, and entertainment facilities for 15 days

3/20
Total of 171 countries and territories have issued entry bans and/or suspended visas for travelers from South Korea.

3/17
1) 11.7 trillion won worth of the 2020 supplementary budget is passed

2) Third postpone for the start of school semester from 26 March to 6 April

The Number of Test Cases and the Confirmed Cases(accumulated)

Note: The analysis is based on the data within 30days.
Data: Korea Center for Disease Control & Prevention. Analyzed by Ko Lab

As of 21 MAR 2020

Government Responses to COVID-19 in China

1.31
 - health experts warn patients can get reinfected
 - China starts repatriating people to Wuhan

1.30
 - Tang Zhihong removed (The health commission head for Huanggang)
 - Roads to Hubei suspended

1.29
 - Extension of business prohibition period

1.28
 - Xinyang suspended ferry services

1.27
 - all Hubei cities had been quarantined
 - Li Keqiang conducted a trip to Wuhan
 - China's Finance Ministry & National Health Commission extended 60.33 billion yuan to cope with coronavirus
 - Wuhan suspends visa, passports services
 - mayor of Wuhan admits mistakes
 - Shanghai : Companies cannot resume work

1.26
 - leading group on the prevention and control of the COVID-19 outbreak was established(chair: Chinese Premier Li Keqiang)

1.25
 - building of makeshift hospital
 - Xi says China faces 'grave situation' as virus death toll hits 42

1.24
 - restricted the inbound and outbound traffic sequently (Huangshi, Chibi, Jingzhou, Yichang, Xiaogan, Jingmen, Zhijiang, Qianjiang, Xiantao, Xianning, Dangyang and Enshi)
 - 1 public health emergency declared (Hubei, Anhui, Tianjin, Beijing, Shanghai, Chongqing, Sichuan, Jiangxi, Yunnan, Shandong, Fujian, Guangxi, and Hebei)
 - Jingzhou closed
 - Beijing , Shanghai government : self quarantine for 14 days strongly recommended to those who visited regions with COVID 19

1.23 : Wuhan lockdown
 - reported to have raised food prices normalized the prices (by local market regulation administrators)
 - level 1 public health emergency declared in Zhejiang, Guangdong, and Hunan

1.22
 - Wuhan lockdown
 - Wuhan citizens start to escape the city

1.21
 - Prohibition of Poultry trade (Henan, Wuxi, Hefei, Shanghai, Inner Mongolia)

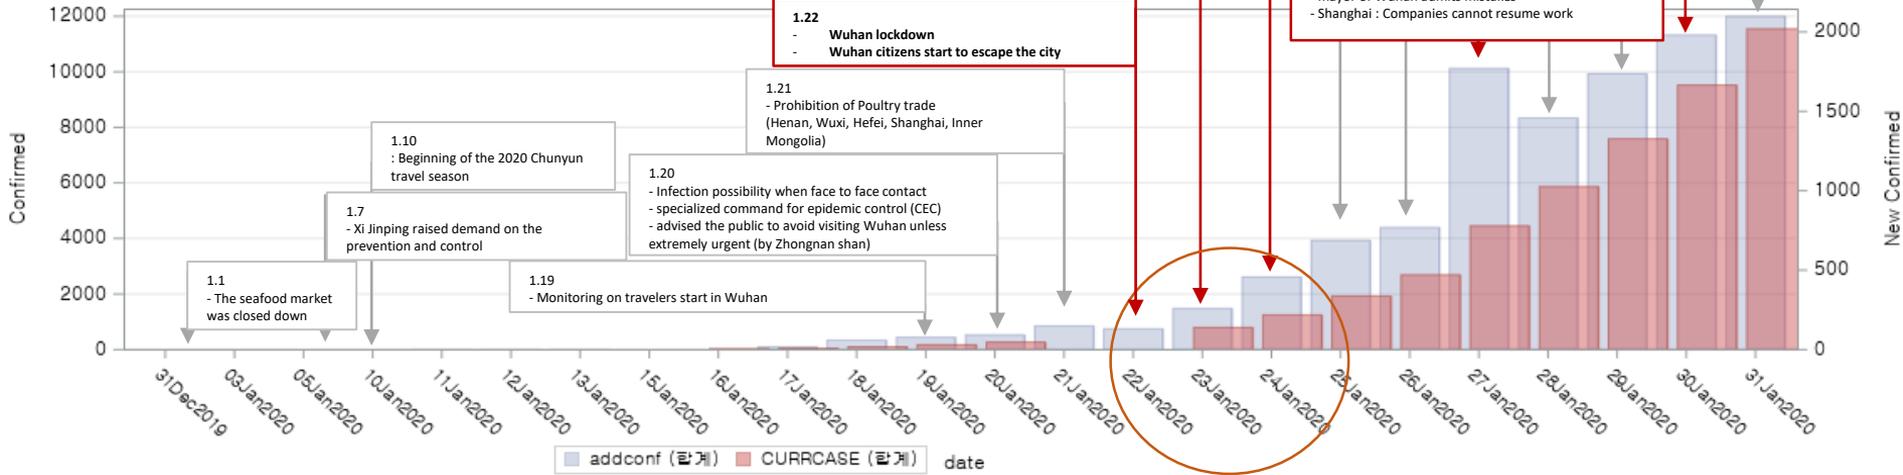

1.20
 - Infection possibility when face to face contact
 - specialized command for epidemic control (CEC)
 - advised the public to avoid visiting Wuhan unless extremely urgent (by Zhongnan shan)

1.19
 - Monitoring on travelers start in Wuhan

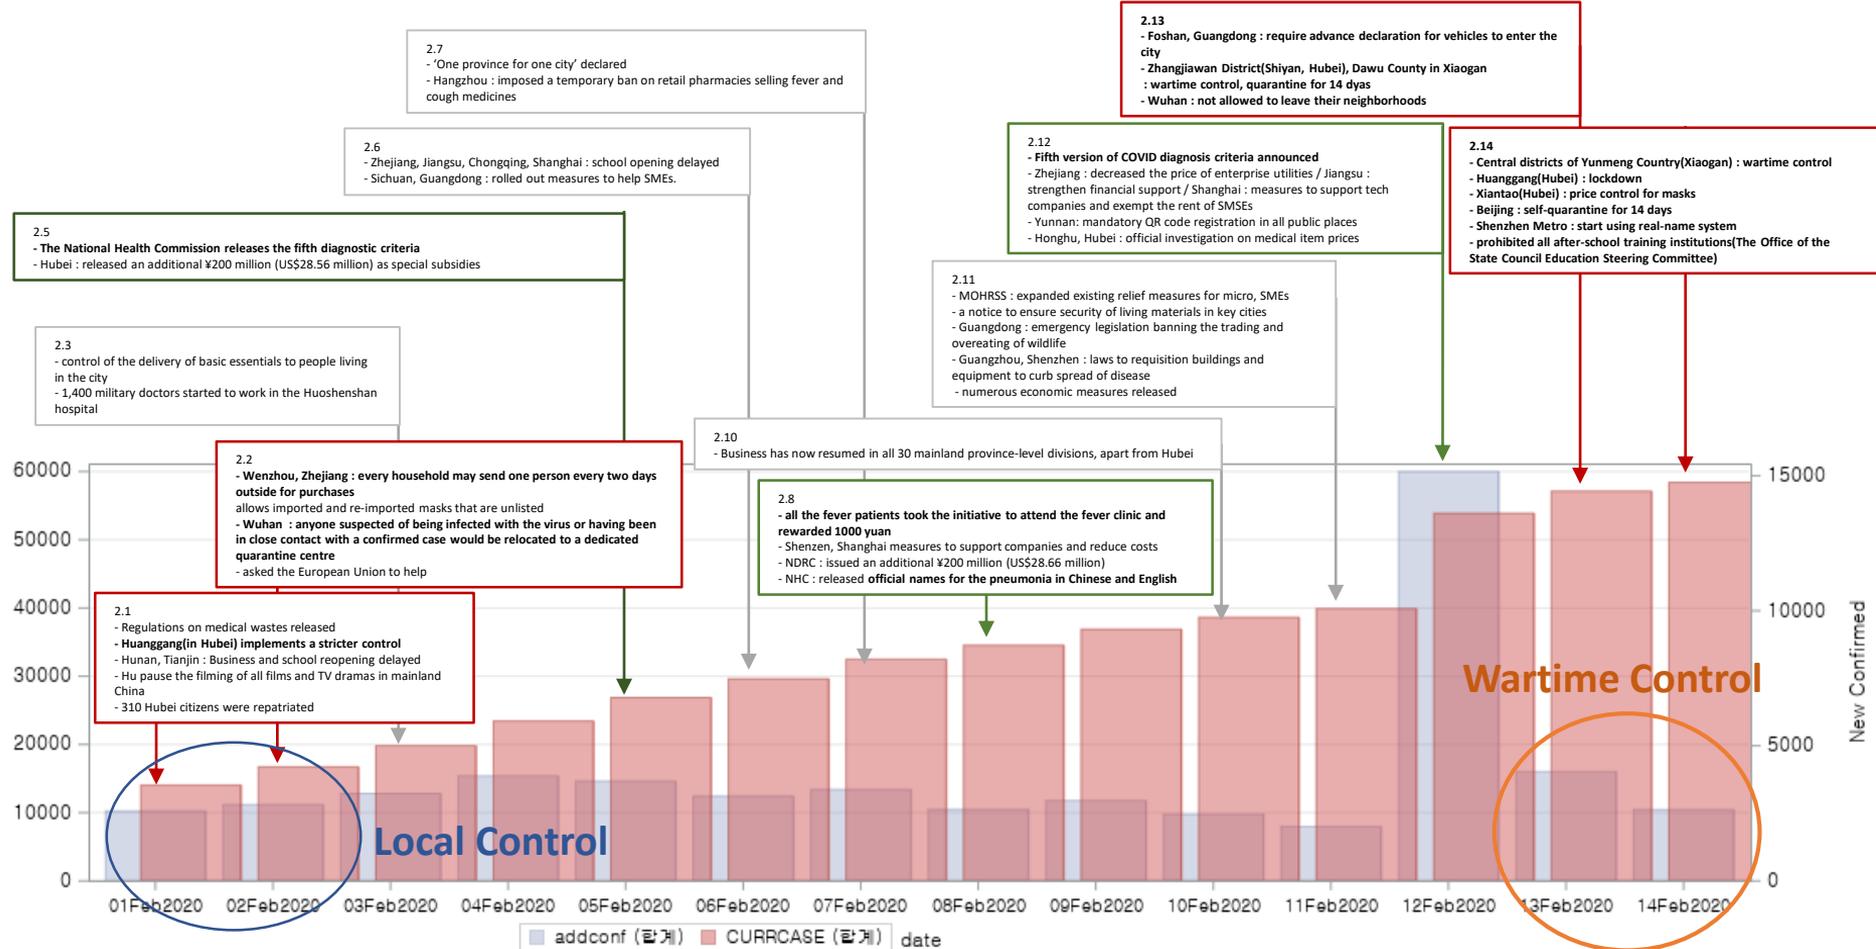

1.10
 : Beginning of the 2020 Chunyun travel season

1.7
 - Xi Jinping raised demand on the prevention and control

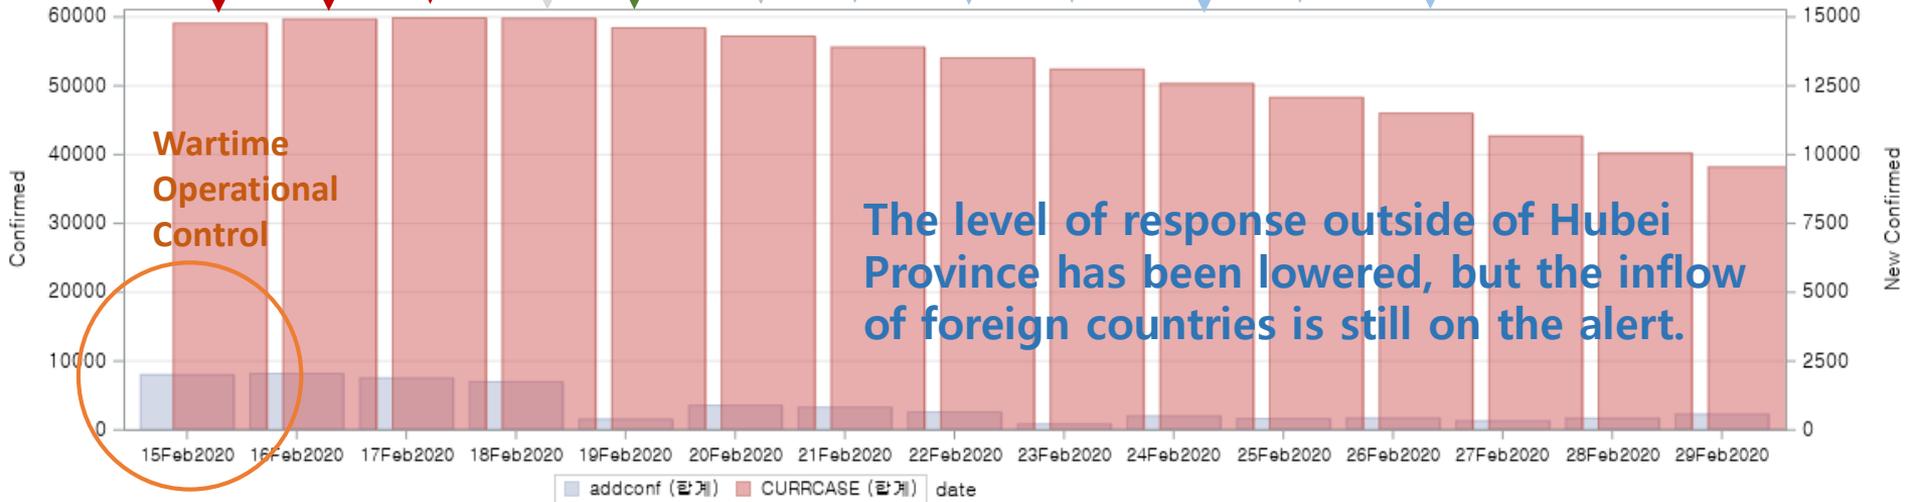

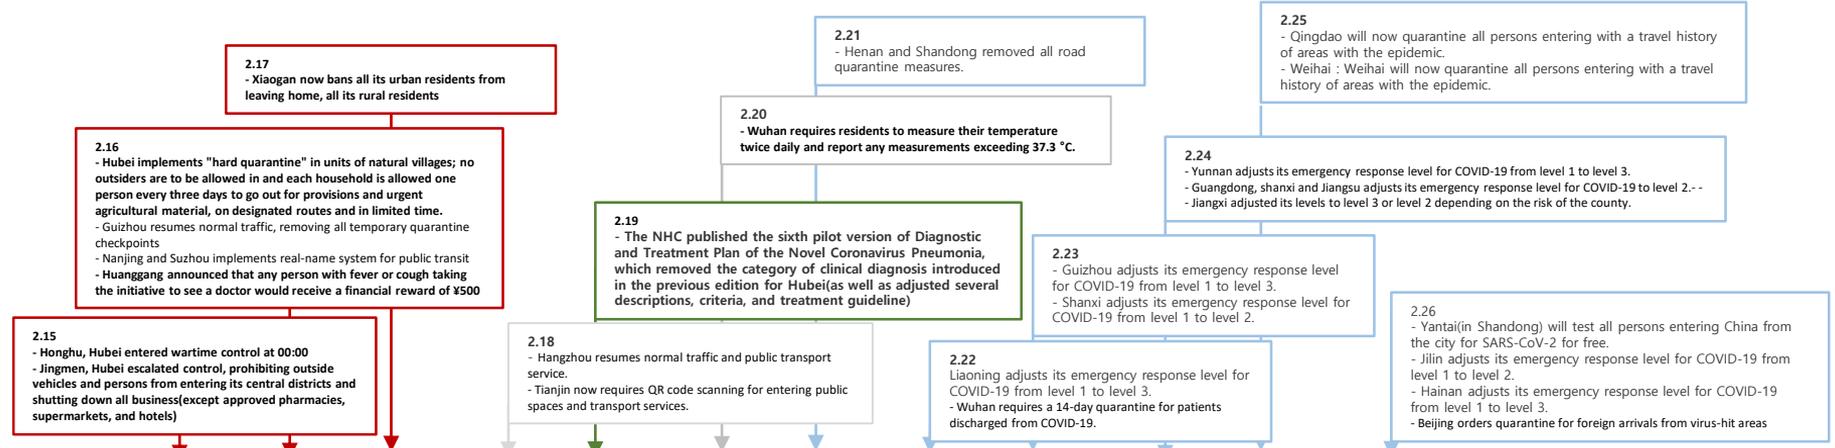

1.1
 - The seafood market was closed down

Government Responses to COVID-19 in China

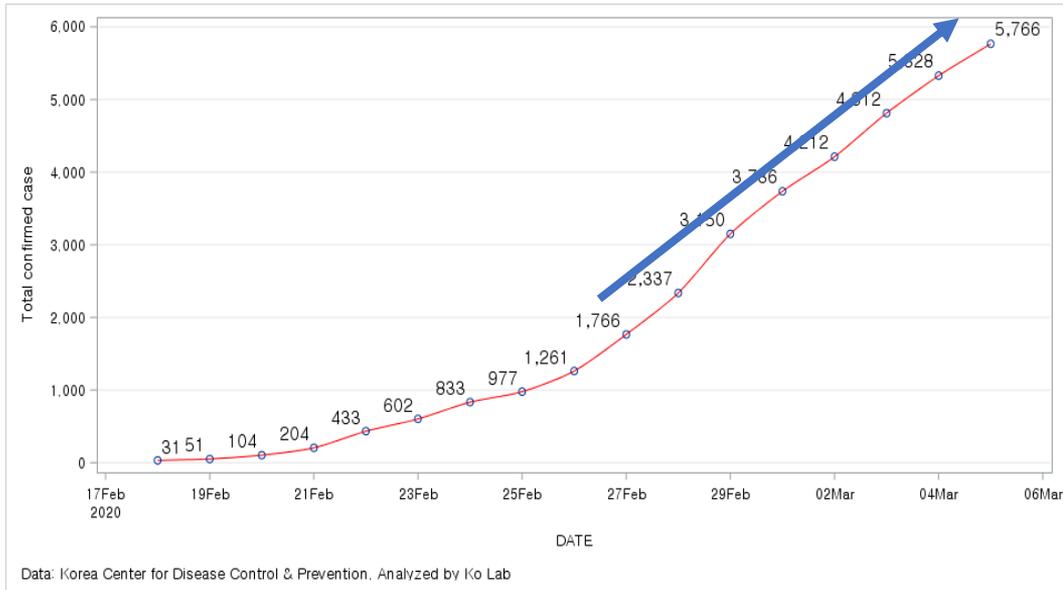

Government Responses to COVID-19 in China

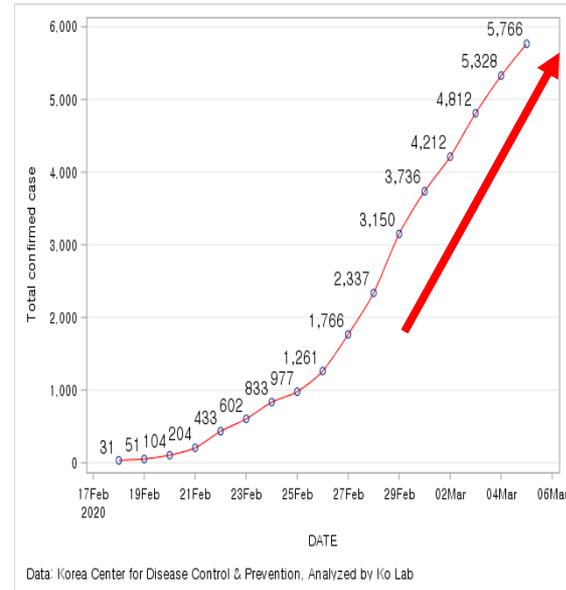

00. Do we know facts well?

► The continuous increase of infection cases ??

: Different perspectives of time (long-sighted vs. short-sighted)

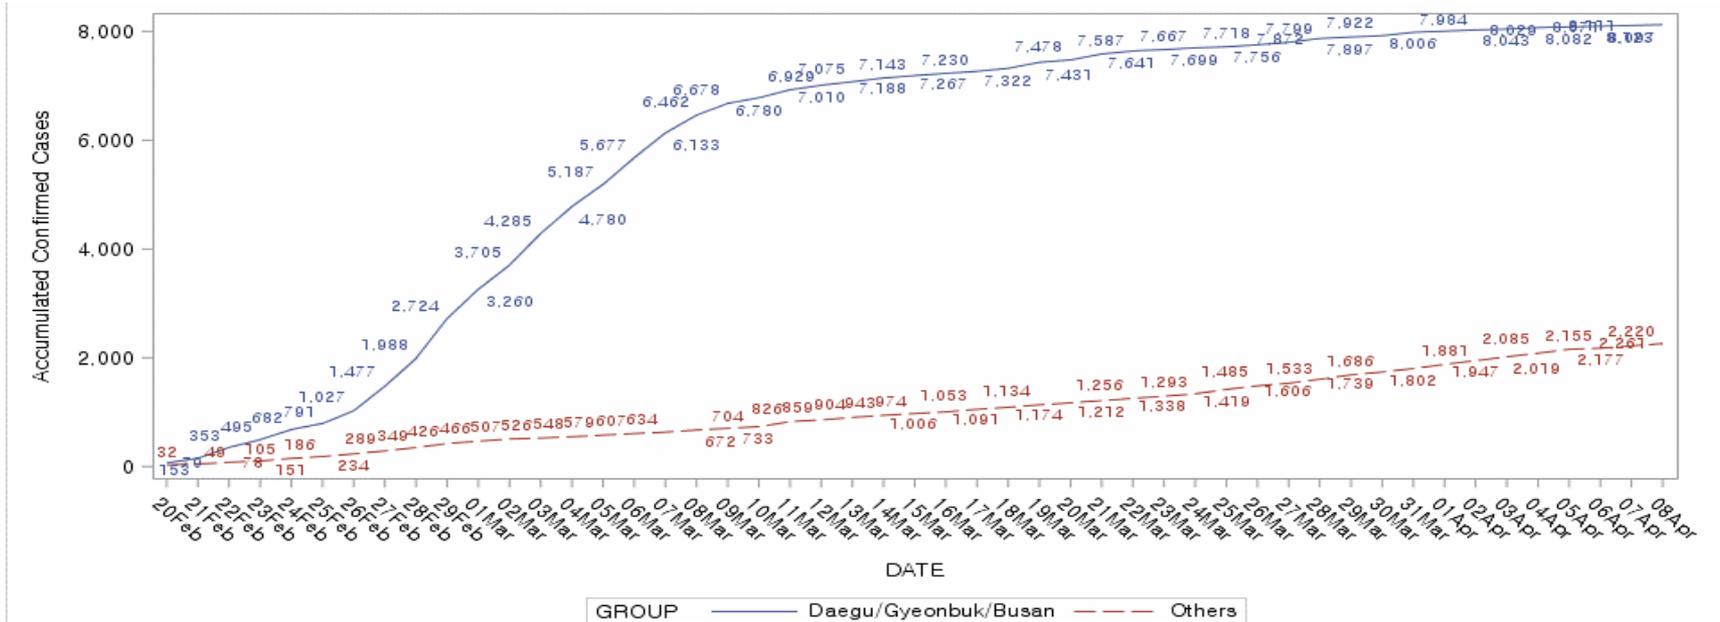

VS

01. Community Infection

▶ Daegu-Gyeongbuk regions were heavily hit by community infection related to Shincheonji

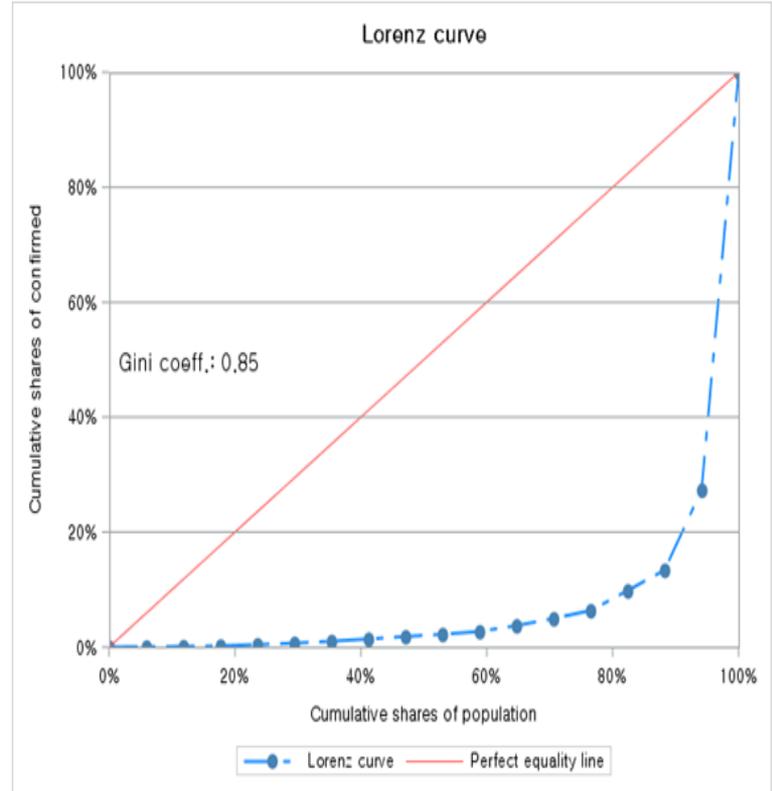

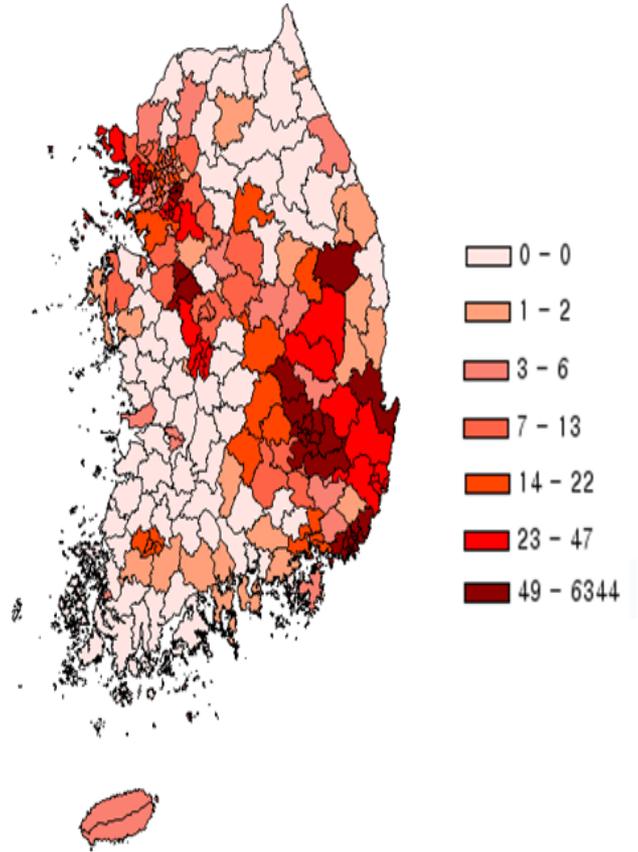

81.9% of infections are community infection.

As of 4pm, March 1, Ko Lab, Seoul National University

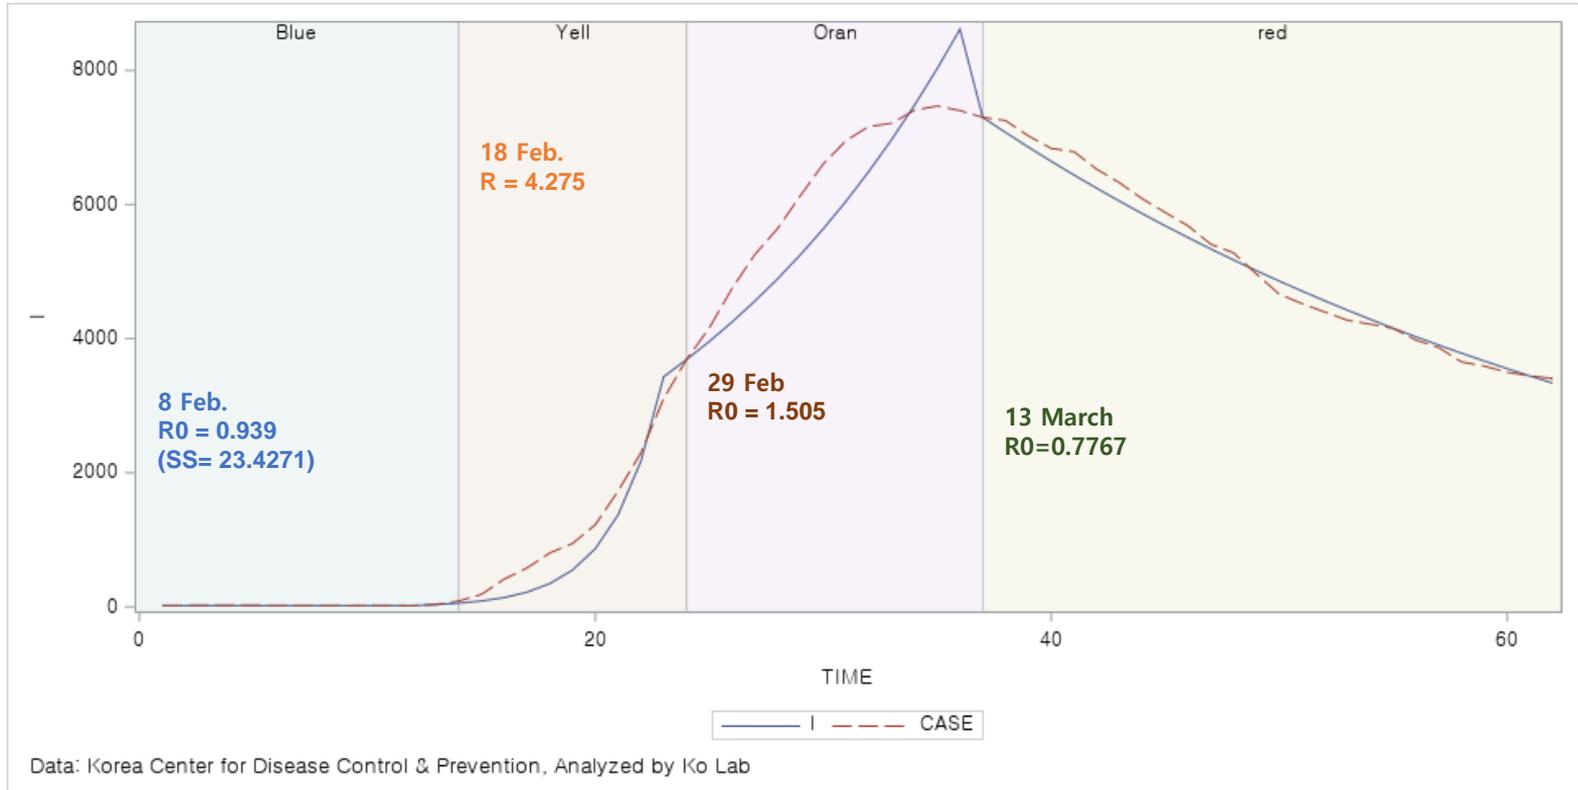

01. Community Infection

▶ Daegu-Gyeongbuk regions were heavily hit by community infection related to Shincheonji

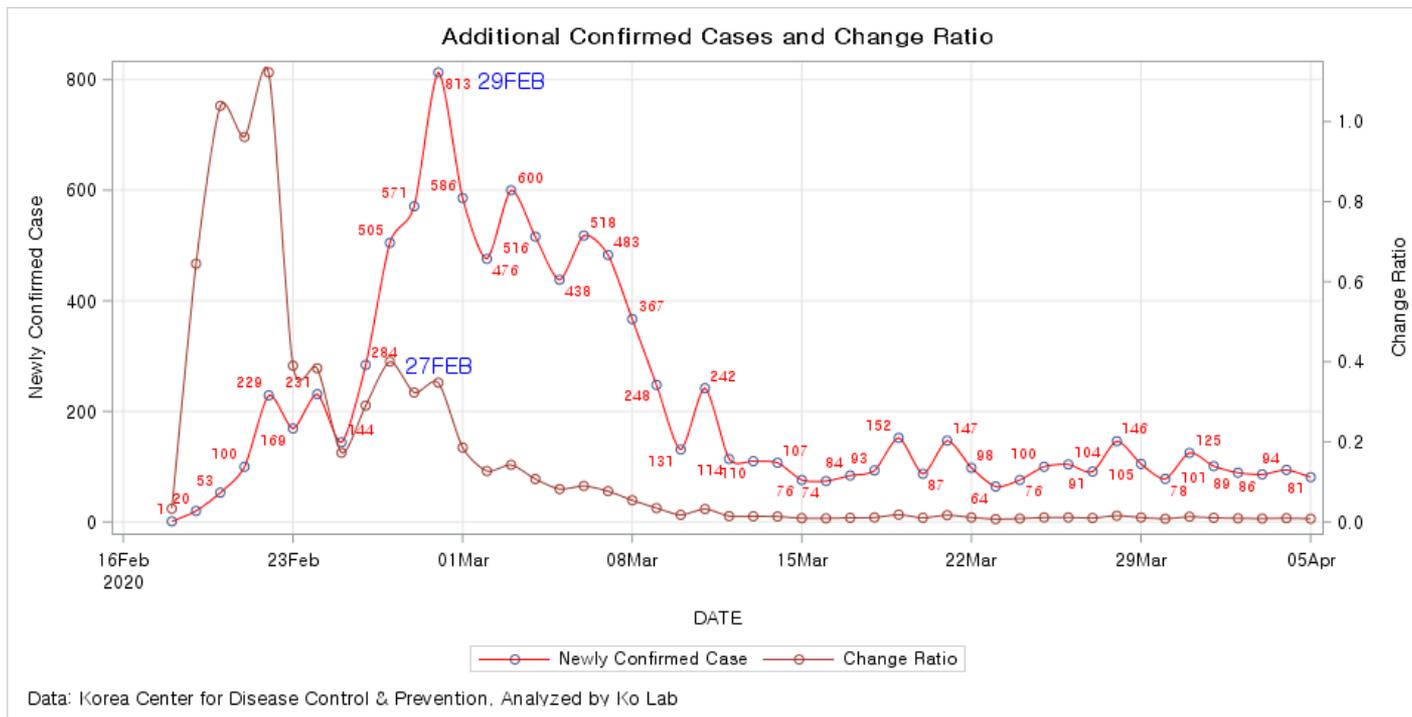

01. Community Infection

► Estimation of reproduction rate (R_0) by period (SIR model)

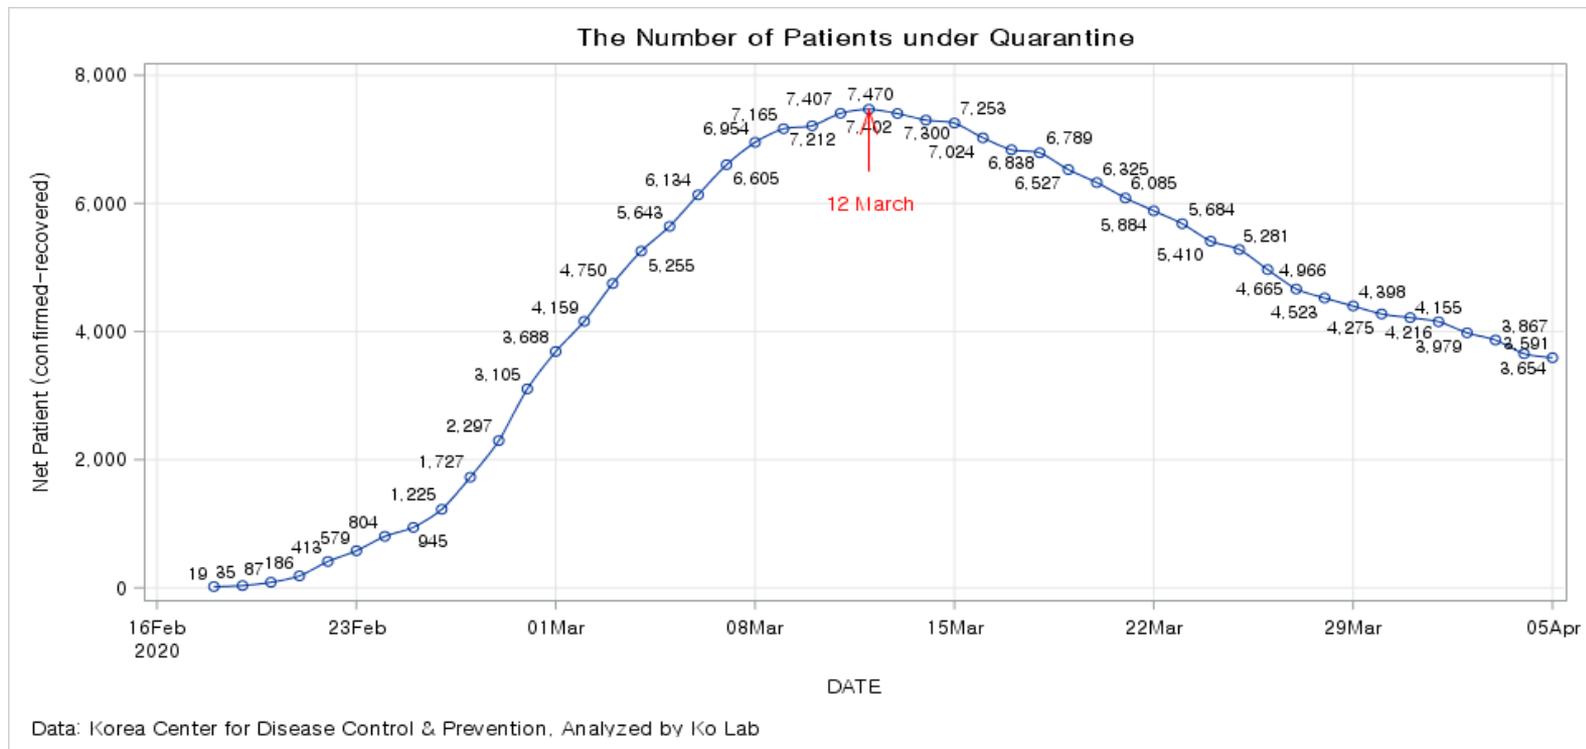

02. When is a turning point?

► Optimistic policymaker: Trend of new case and/or change ratio

02. When is a turning point?

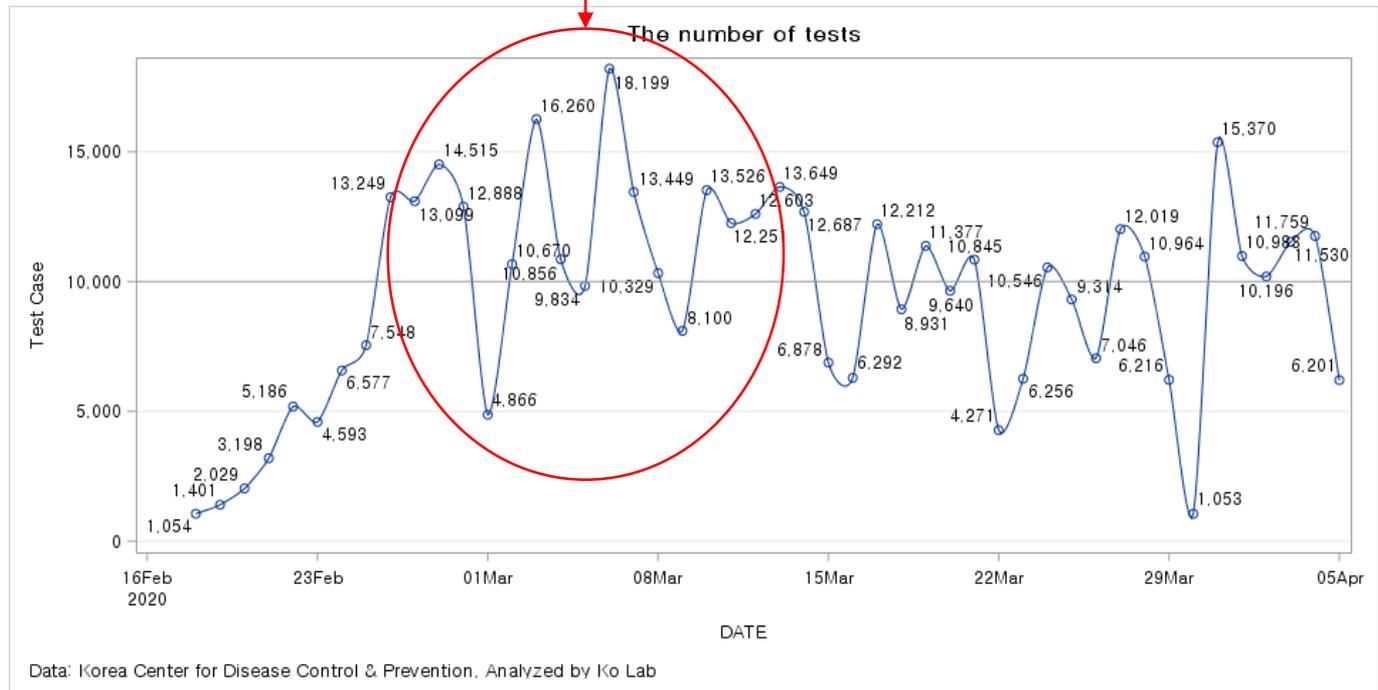

► Conservative policymaker: Trend of net quarantine patients

03. Do not let your guard down

► Successful preemptive test policy but...

Note that the comprehensive tests were done almost a week later

KCDC ordered self-quarantine to Shincheonji Christians on Feb 25.

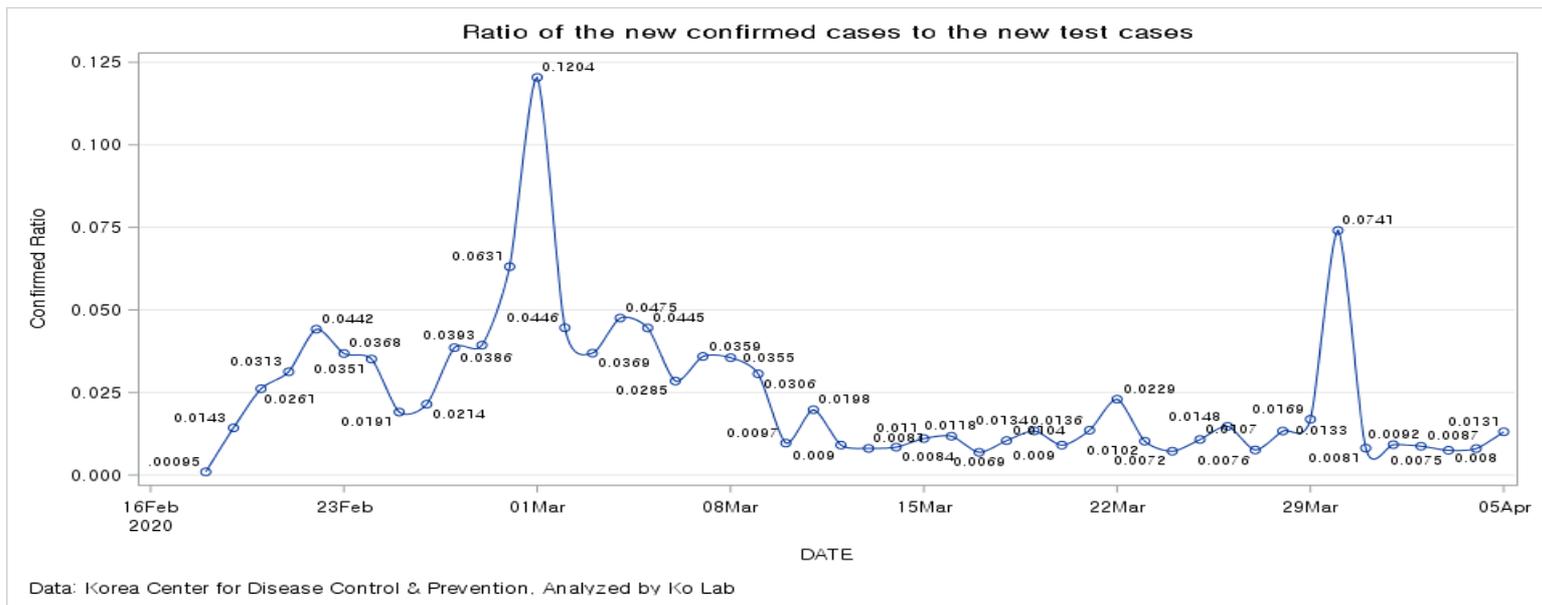

04. No free lunch: cost-effectiveness of the test

► Cost-effectiveness

1) Cost per test: 150USD

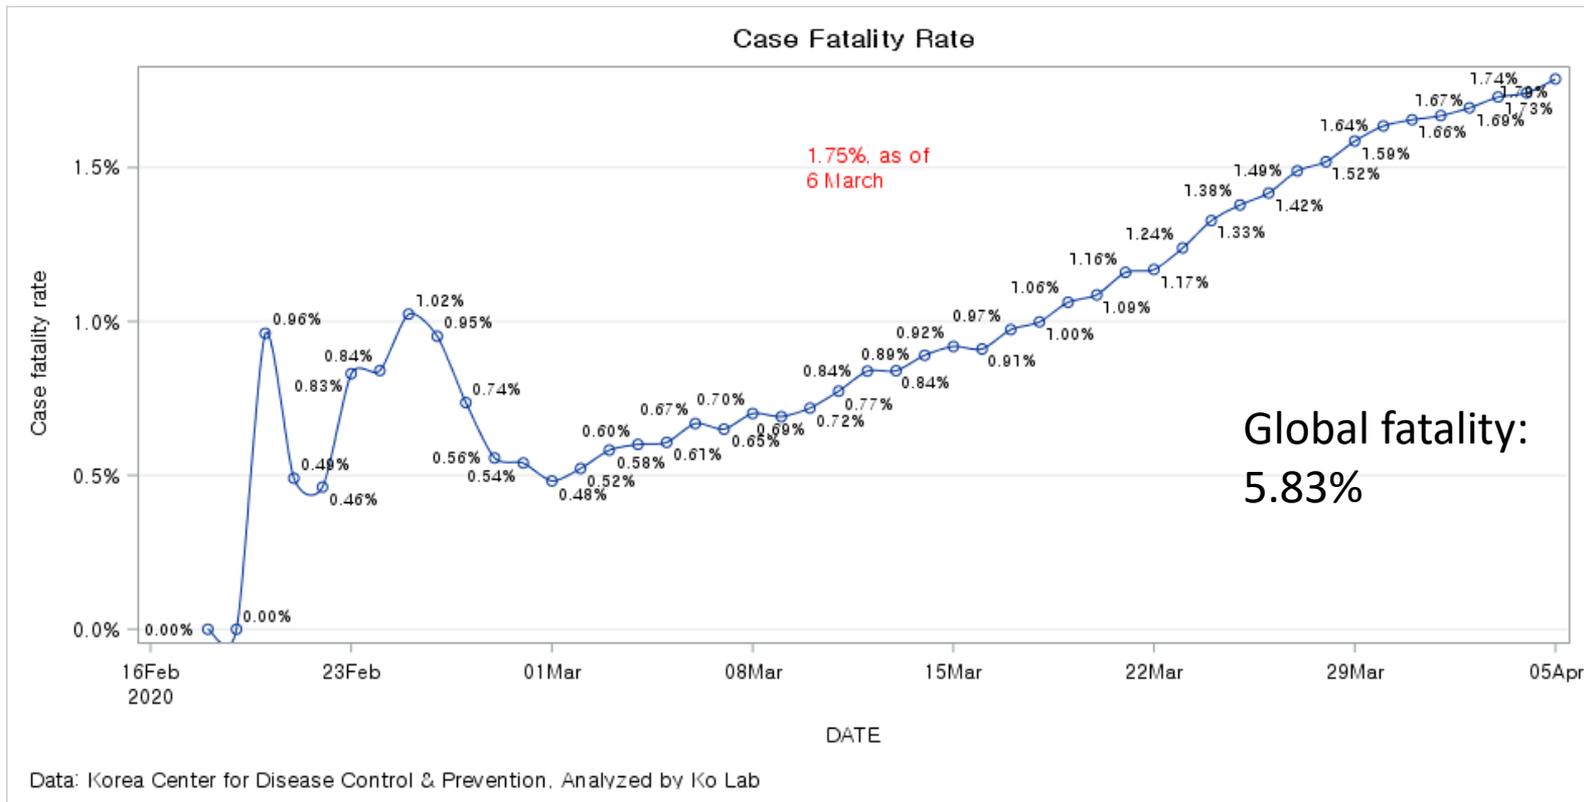

2) # of test per day: 10,000 → 1.5Mil. USD / Detection rate=1% -> 100 case

Therefore, are we willing to pay **15,000USD** for detecting additional patient?

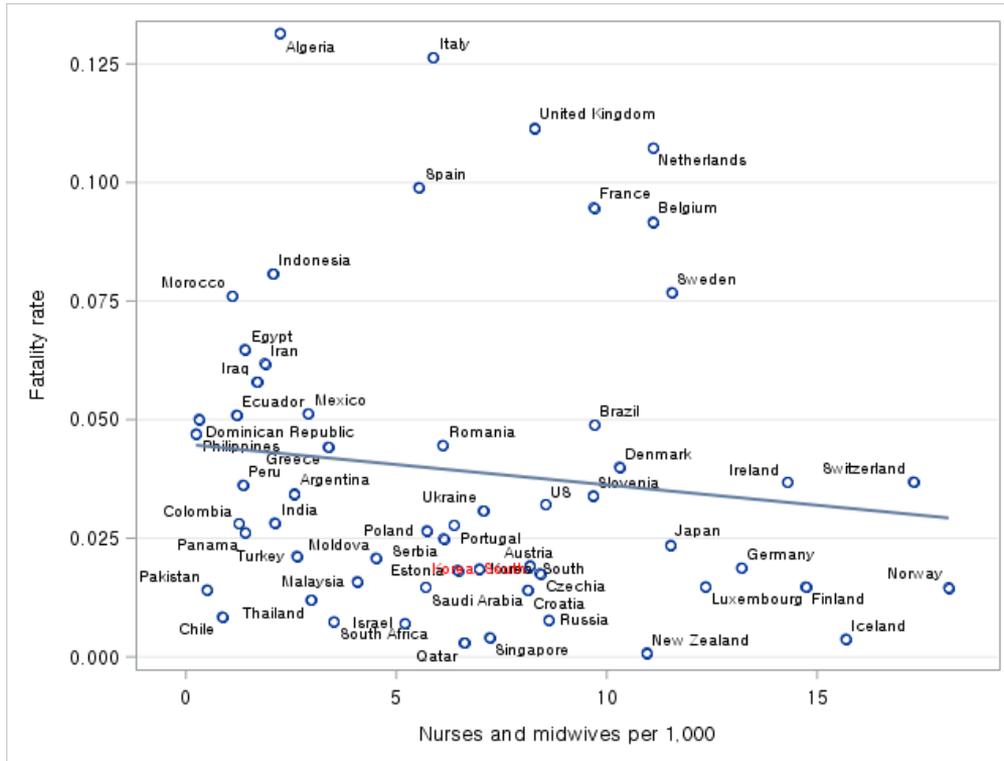

04. Effectiveness of medical staffs

▶ Remarkably low fatality rate

04. Effectiveness of medical staffs

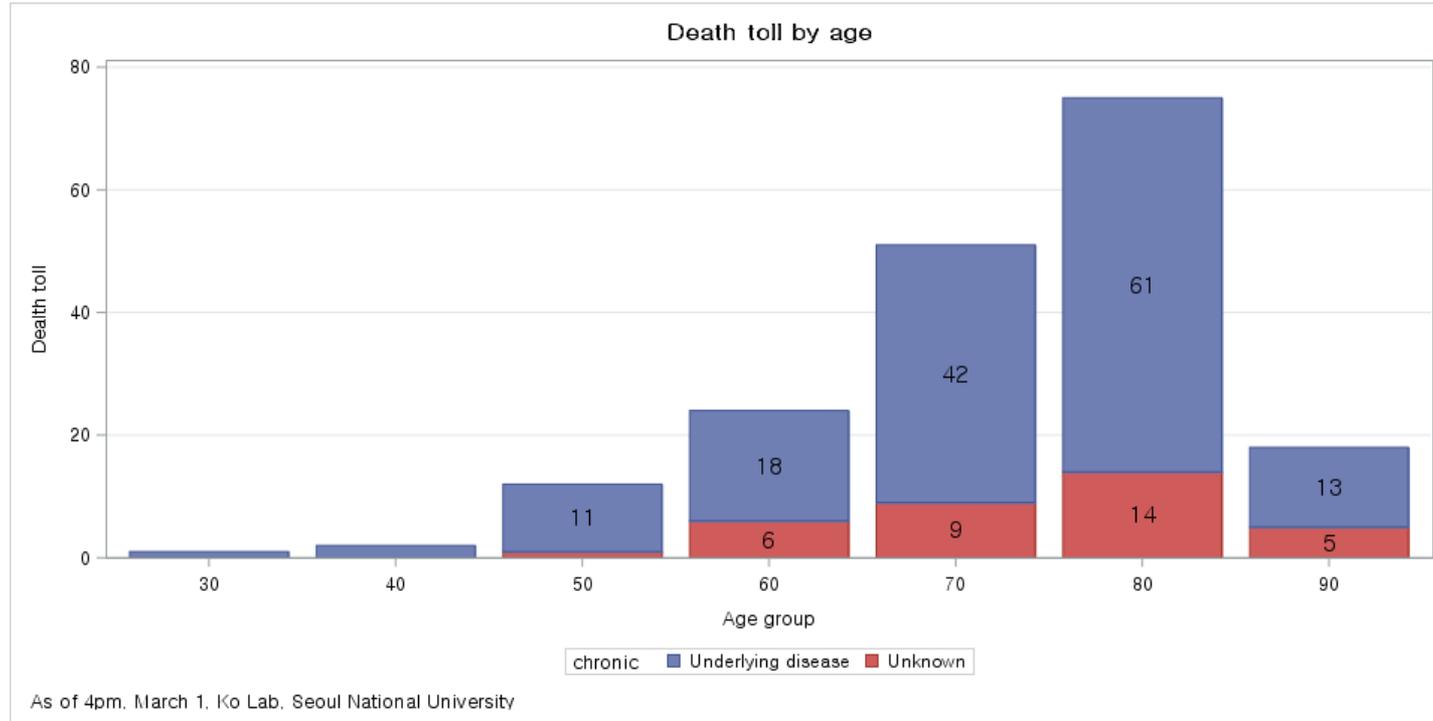

► Low fatality rate despite small # of nurses per 1,000 people

Note that the regression model is not suitable yet because of large variation among countries and less stabilized fatality rate of each country

04. The cause of the 3rd factor

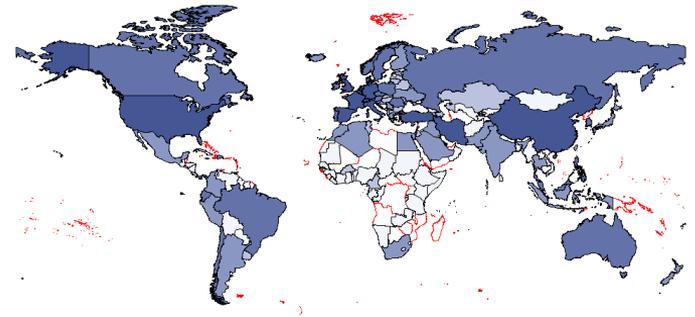

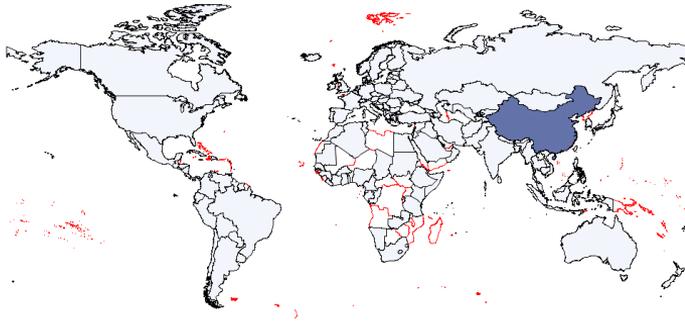

► Majority of people who died in South Korea had underlying disease

05. Global Trends

▶ Feb 1, 2020

April 5 2020

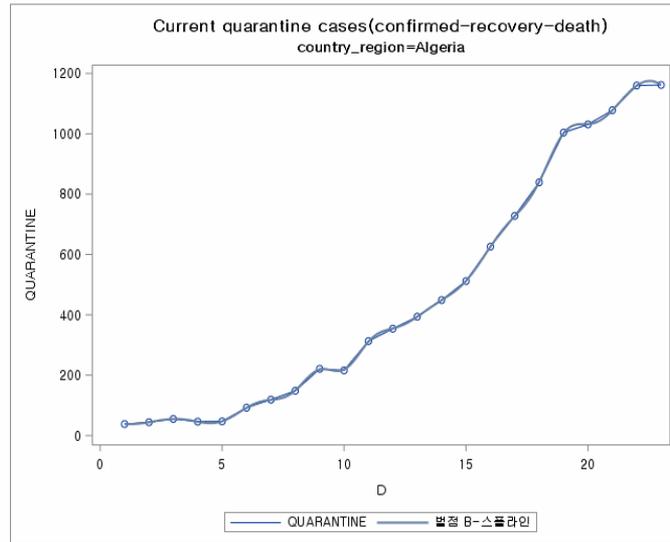

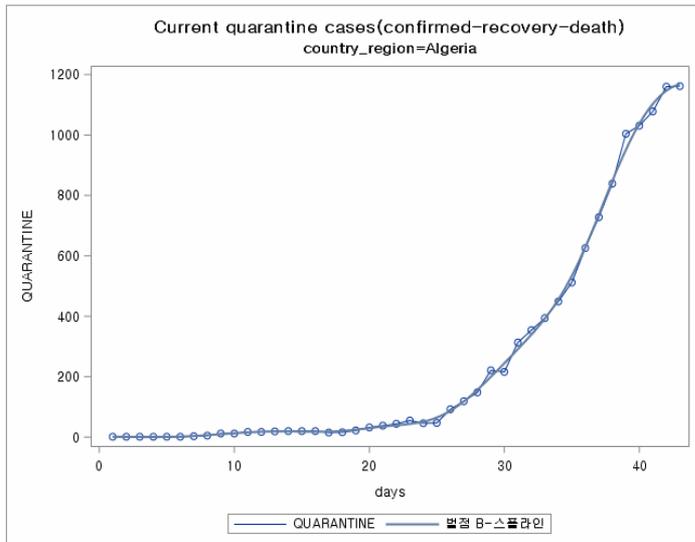

CONFIRM 100 500 1000 5000 20000

CONFIRM 100 500 1000 5000 20000

Is the global society well prepared even after the COVID-19 outbreak in China?

05. Global Trends

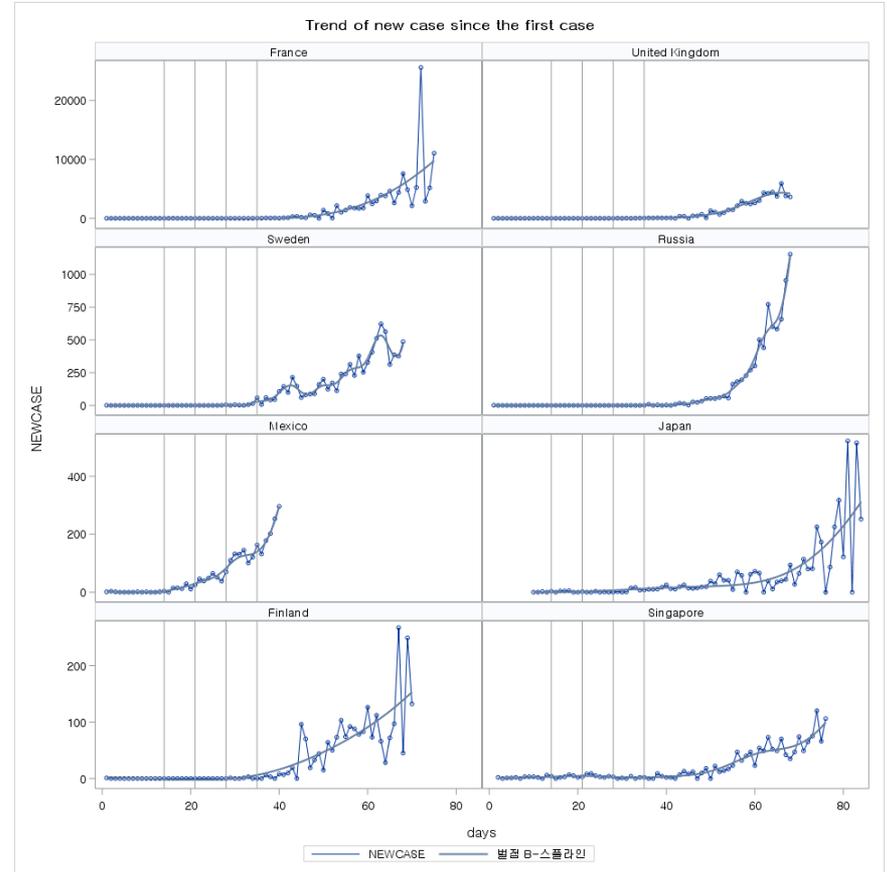

► No hope of the spring to come??

- **Long left tails** → **Unpreparedness**
- Many countries are in hockey stick shape, but **some countries (Italy, US, Swiss, etc)** begin to follow **inversed U-shape**.

05. Global Trends

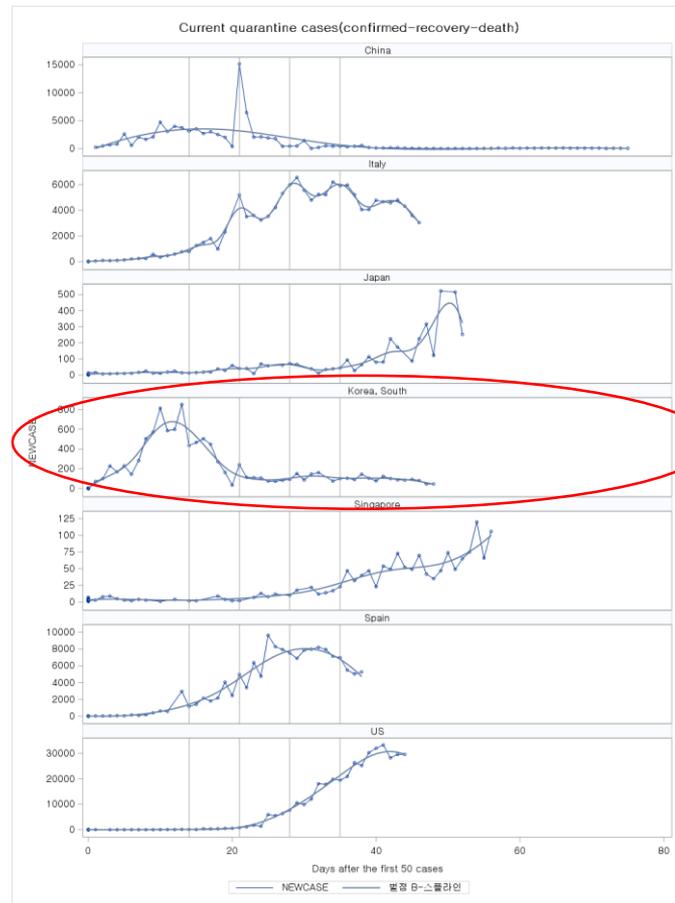

▶ Winter is not over yet in some countries

05. Global Trend

▶ Does the Korean trend differ from that of other countries?

- Most countries' trend are hokey stick shape or premature inverted-U shape.
- However, Korea only took two weeks for arriving a plateau of new case trend and shows inverted-U shape now.

06. Implications

<Fact 1>

While there was unsatisfactory responses in preventing community infection in some regions, Korea successfully control COVID-19 considering the low fatality rate, quick control, and the flattened curve.

<Fact 2>

Draconian international and domestic travel ban would not be a mandatory and cost-effective policy.

<Fact 3>

Who knows the best timing?

<Fact 4>

As different infection and fatality risk by age is real, government's policy should be implemented accordingly.

06. Implications

<Fact 5>

The world should prepare the post-COVID19 era as more countries will approach to the golden-cross stage soon.

<Fact 6>

We need to deliver accurate information. Some make people too scared, others make too optimistic.

<Fact 7>

Sharing the experiences in a global context with international cooperation on data collection, analysis, and policy for better preparedness in future

06. Implications

ARIC's next agenda:

- ◆ DB and analysis of the impacts of COVID19 to socio-economic system
- ◆ Developing the better pandemic tracking platform (e.g. SNU CRN, WHO, etc.)
- ◆ Nurturing the next generation of policy analytics experts

ARIC is open to all for collaboration !!!

THANK YOU
